An Update on Carotid Ultrasound Measurement of Intima

Ultrasound measurement of carotid intima-media thickness (IMT) is a well validated and useful method for detecting and monitoring progression of atherosclerosis. Carotid IMT correlates with traditional cardiovascular risk factors and coronary atherosclerosis severity.

Ultrasonographic measurement of carotid intima-medial (also called intimal-medial or intima-media) thickness (CIMT) refers to the use of B-mode ultrasound to determine the thickness of the two innermost layers of the carotid artery wall, the intima and the media. Ultrasonographic measurement of CIMT has been examined as a

Measurement of Carotid Artery Intima Thickness

Carotid ultrasound provides quantitative measurements of carotid intima-media thickness (CIMT) that can be used to assess cardiovascular disease (CVD) risk in individuals and monitor ongoing ...

Ultrasonographic measurement of carotid intima-medial (or intimal-media) thickness (CIMT) refers to the use of B-mode ultrasound to determine the thickness of the 2 innermost layers of the carotid artery wall, the intima and the media.

Ultrasonographic Measurement of Carotid Intima-Medial

CIMT measurement and determination of carotid plaque presence was detected by ultrasound. Adherence to the Mediterranean diet was assessed by a 14-point food-item questionnaire. Subclinical atherosclerosis was

defined by CIMT ≥ 0.9 mm or ≥ 1 carotid plaque.

Ultrasound measurements of carotid intima-media thickness

Ultrasonographic measurement of carotid intima-medial (or intimal-media) thickness (CIMT) refers to the use of B mode ultrasound to determine the thickness of the 2 innermost layers of the carotid artery wall, the intima and the media. Detection and monitoring of intima-medial thickening, which is a surrogate marker for atherosclerosis, may provide an opportunity to intervene earlier in ...

Ultrasound measurement of intima-media has strongly correlated with histological thickness vessels prone to atherosclerosis, in particular carotid and coronary arteries [13,14].

Cardiovascular Ultrasound - The Barwon Infant Study-BIS

The construction of images with ultrasound is based on the measurement of distances, which relies on this almost constant propagation velocity. The velocity in bone (ca. 3600 m/s) and cartilage is, however, much higher and can create misleading effects in images, referred to as artefacts (see below). The wavelength of ultrasound influences the resolution of the images that can be obtained; the ...
